

# A dependable Contact Management System for your key Business assets

Laurus is a CMS (Contact Management System) built on Oracle.

Laurus is an integrated solution that enables organisations and individuals to record relationships and interactions with customers and suppliers. This information includes all emails, documents, jobs, faxes, calendars and more.

This type of solution is for companies wanting to be able to control all this information from a single integrated application, instead of having different proprietary desktop applications, each with their own data storage and format.

## Key Features:

- Central/Secure repository for all Customer/Supplier information (Name, Address, Phone, Email, Web-site etc).
- Stores Notes, History and attached Documents so all information is held in one place and shared for by all users.
- Capability to add additional Tabs and Fields to the system (customisation) – this can be done by Teams or System wide.
- All Fields, Notes and attached Documents can be searched very quickly – Google style rated search.
- Users can set Reminders against Contacts and so create their own “To-do” lists.

## Platform/Architecture:

- Web based so can be used both internally and remote/externally (secure).
- Based on Oracle so fully scalable, robust and secure.
- Shared system for potentially an infinite number of users.
